AMENDMENTS TO THE CLAIMS

Please amend claims 6-9 as indicated below.

1-5. (Canceled)

- 6. (Currently amended) A method for the preparation of a reagent for use in diagnosis of schizophrenia in an individual by detecting a DTH reaction in said individual following injection of said reagent to the individual, comprising:
 - a) obtaining blood samples from a number of individuals, preparing a pool from said samples and collecting platelets therefrom;
 - b) preparing a protein fraction from said platelet preparation comprising proteins or fractions thereof, wherein the pI of said proteins or fractions thereof is greater than or equal to about 6.5 having a pI of above about 6.5.
- 7. (Currently amended) A diagnostic method for determining schizophrenia in a subject comprising:
 - a) obtaining a preparation comprising platelet derived proteins or fractions thereof, wherein the pI of said proteins or fractions thereof is greater than or equal to

ے اغ

about 6.5 having a pI of above about 6.5;

- b) injecting said preparation into a subject; and
- c) examining the subject for the occurrence of delayed type hypersensitivity reaction at the site of the injection, a positive result being a reaction above that which is observed in non-schizophrenic subjects, indicating that the subject has a high likelihood of being schizophrenic.
- 8. (Currently amended) A diagnostic method for determining schizophrenia in a subject comprising:
 - (a) obtaining a blood sample from a number of schizophrenic or non schizophrenic individuals other than the tested subject and collecting platelets therefrom;
 - (b) preparing a protein fraction from said platelet separation comprising proteins or fractions thereof, wherein the pI of said proteins or fractions thereof is greater than or equal to about 6.5 having a pI of above about 6.5;
 - (c) injecting said protein preparation into a subject; and
 - (d) examining the subject for the occurrence of a delayed type hypersensitivity reaction at the site of the

p. 4

injection, a positive result being a reaction above that which is observed in non-schizophrenic subjects, indicating that the subject has a high likelihood of being schizophrenic.

- 9. (Currently amended) A diagnostic method for determining schizophrenia in a subject comprising;
 - a) obtaining a blood sample from an individual and collecting platelets therefrom;
 - b) collecting proteins or fractions thereof from said platelet sample, wherein the pI of said proteins or fractions is greater than or equal to about 6.5 said proteins or fractions having a pI of above about 6.5.
 - c) injecting said collected proteins or fractions thereof to the tested individual; and
 - d) examining the subject for the occurrence of delayed type hypersensitivity reaction at the site of the injection, a positive result being a reaction above that which is observed in non-schizophrenic subjects, indicating that the subject has a high likelihood of being schizophrenic.

- 10. (Previously presented) The method of claim 6, wherein said proteins or fractions thereof have a pI within the range of above 6.5 to about 9.5.
- 11. (Previously presented) The method of claim 7, wherein said proteins or fractions thereof have a pI within the range of above 6.5 to about 9.5.
- 12. (Previously presented) The method of claim 8, wherein said proteins or fractions thereof have a pI within the range of above 6.5 to about 9.5.
- 13. (Previously presented) The method of claim 9, wherein said proteins or fractions thereof have a pI within the range of above 6.5 to about 9.5.
